**FACULTY PRESENTATIONS**  
**2:30-4:30 p.m.**  
**Price Center Forum (4<sup>TH</sup> Floor)**

**Structural Engineering**

**2:30 p.m.**

**Patrick J. Fox, Professor**

**“Research on Earthquake Performance of Large-Scale Geotechnical Structures”**

Earthquakes pose a serious hazard to many areas of the U.S., including Southern California. Professor Fox will present an overview of current research efforts to better understand the seismic performance and survivability of geotechnical structures, such as retaining walls and bridge foundations, through large-scale testing at the UC San Diego Englekirk Structural Engineering Center.

**Computer Science and Engineering**

**2:50 p.m.**

**William G. Griswold, Professor**

**“CitiSense – A Participatory Air Quality Sensing System for Real-Time User Feedback”**

Government pollution monitoring is sparse, reporting regional measures, not individual exposure. CitiSense consists of a body-worn low-power board, a back-end server for machine learning and sharing, and a smartphone application that relays sensor readings from board to server, and displays exposure information. Studies show effects on user awareness and behavior.

**Mechanical and Aerospace Engineering**

**3:10 p.m.**

**Juan C. Lasheras, Professor**

**“Master of Advanced Study in Medical Device Engineering”**

The new Master of Advanced Study in Medical Device Engineering is aimed at professional engineers who plan to become technical leaders in the field of biomedical instrumentation and devices. Specialized coursework includes clinical needs assessment, mechanics and transport, modern life science technologies, anatomy and physiology, biomaterials, wireless embedded controls, and computer aided design. The program includes a design and prototype option as well as a focus on relevant business issues.

## Bioengineering

3:30 p.m.

### **Todd P. Coleman, Associate Professor**

#### **“Tattoo Electronics for Biomedical Applications”**

Thin, flexible, invisible electronics that can be embedded in temporary tattoos, can sense multiple modalities of biological signals, and can wirelessly transmit them to a mobile device, show great promise for transforming the practice of medicine from periodic monitoring of signals with bulky, wired sensors in hospital settings to continuous monitoring of health with invisible wireless sensors in natural environments.

## NanoEngineering

3:50 p.m.

### **Jennifer N. Cha, Associate Professor**

#### **“Biomolecular Architectures and Systems for Nanoengineering Thin Film Devices”**

While nanomaterials have shown great potential for electronic and photonic applications, their organization onto surfaces for incorporation into functional devices has remained difficult. To address some of these challenges, Professor Cha will describe recent efforts to self-assemble nanoscale materials on surfaces with control over material location and crystallographic orientation.

## Electrical and Computer Engineering

4:10 p.m.

### **Gert Lanckriet, Associate Professor**

#### **“Music Search and Recommendation”**

Thanks to a revolution in music production and distribution, unprecedented amounts of new music proliferate the web from every corner of the world. By developing novel music recommendation algorithms and search technologies, Professor Lanckriet’s work is poised to have a broad societal impact by helping millions of users find and organize musical content.
